

# Does everything that touches your skin *look* like it's going to hurt?

**If parts of your skin have a stabbing, burning, shooting pain feeling, it could be a symptom of peripheral neuropathic pain. Now consider this study of an investigational pain medication that's taken once a day.**

Living with peripheral neuropathic pain (PNP) can be unpredictable and agonizing. You never know when it's going to strike, or how many times you'll have to deal with intensely painful sensations on a daily basis. If you experience pain when you touch something that shouldn't hurt, or if you have exaggerated pain when you touch something that should only cause a little pain, you may have PNP with mechanical hypersensitivity.

Although current pain relievers can often help relieve these symptoms, new treatment options are still needed today.

That's why local doctors are currently conducting GRIZZLY, a medical research study evaluating an investigational pain medication for PNP with mechanical hypersensitivity.

**To pre-qualify for the GRIZZLY study, you must:**

- Be 18-80 years of age AND
- Be experiencing painful symptoms due to peripheral neuropathic pain associated with mechanical hypersensitivity for at least three months or up to five years

Qualified participants will receive study medication as well as study-related medical evaluations and tests at no cost. Reimbursement for time and travel may also be provided.
